

Air Charter Safety: PASS Program

Be Assured your Private Air Charter is Safe

If you want to make sure that safety is more than a buzzword on a website, that the aircraft you charter are truly safe for your family, friends, company and personal needs, then look for charter services utilizing PASS.

What is PASS?

PASS stands for Pilot & Aircraft Safety Survey, a new program developed by Wyvern, an industry leading technology and information service provider, to perform comprehensive trip safety due diligence on each private flight assigned by a participating air charter service operator.

The Pilot & Aircraft Safety Survey replaces old systems with advanced data crawlers that aggregate almost all information on important aspects of flight safety automatically, including operator, aircraft and crew. The pilot check, for example, verifies pilots' medical status, training records, flight hours and other criteria to assure they meet all FAA requirements. The engine then summarizes the findings into an easy-to-read report for the air charter vendor.

After - and only after - an assigned aircraft and crew has been verified by PASS will the participating air charter service operator confirm the flight.

Jet Methods Stepping Up for Safety

PASS is a volunteer program. So you can be confident that any air charter service operator you see using this service is going the extra mile to ensure customer safety. And, most importantly, this check is performed in addition to existing standards of safety already in effect.

Jet Methods was among the first air charter service operators to sign up for the PASS program, which has been met with great success as a comprehensive, yet easy-to-use due diligence system on every trip. Be sure to ask for a PASS report for your next flight!
